

Department of Mechanical Engineering and Automotive Technology

Automotive Mechatronics Bachelor's

Degree in Automotive Technology

Module Manual

Table of Contents

Preliminary remarks	4
General Business Administration for Automotive Mechatronics	5
Automotive Mechatronics Internship and Occupational Safety	8
Automotive Software Engineering	10
Bachelor Thesis and Colloquium	12
Bus and Communication Systems in Automobiles	14
Business English (B2)	16
CAx Techniques	18
Dynamics and Vibration Theory I	20
Dynamics and Vibration Theory II	22
Introduction to Transport Policy	24
Electric Drives and Power Electronics in Motor Vehicles	27
Electrical Engineering	29
Electronics	31
Electrical Engineering I	33
Electrical Engineering II	35
Production Technology	37
Advanced Dynamics / Machine Dynamics	39
Industry Internship	41
Computer Science for Mechatronics Engineers I	43
Computer Science for Mechatronics Engineers II	45
Automotive Engineering I	47
Automotive Engineering II	48
Construction and Machine Elements	49
Fuel Analysis and Exhaust Gas Measurement Technology	51
Mechatronics in the Power Train	53
Methods of Experimental Methodology	55
Microcontrollers and Embedded Systems	57
Simulation of Mechatronic Systems	59
Automotive Mechatronics Project	61
Project Formula Student	63
Project Management of Mechatronic Vehicle Systems I	65
Project Management of Mechatronic Vehicle Systems II	67

Quality Management	69
Control Technology I	71
Control Technology II	73
Sensor Systems and Actuators in Vehicles	75
Simulation of Mechatronic Systems	77
Statics and Strength of Materials	79
Technical English (B2)	81
Engineering Mathematics I	83
Engineering Mathematics II	86
Engineering Mathematics III	88
Technical Thermodynamics	89
Technical Combustion	91
Internal Combustion Engines I	93
Internal Combustion Engines II	95
Materials Engineering	97
Scientific Foundation of the Bachelor Thesis	99
Scientific/Academic Work and Presentation	101

Preliminary remarks

Module Plan

Specialization in Automotive Mechatronics in the Automotive Technology Program

11-15 16-20 21-25 26-30 1-5 6-10 Semeste WS (1) Computer Science for Electrical Mechatronics Engineering I Engineers I SS (2) Computer General Science for Electrical **Business** Mechatronics Engineering II Administration **Engineers II** WS (3) Project Control Manage Electronics Techonology I ment Techn. SS (4) Modelling of Simulation of Microconrollers and Control CEM Mechatronics Mechatronics and Embedded Busn. Techonology II Systems Systems Systems English

Mathematical - Engineering basics

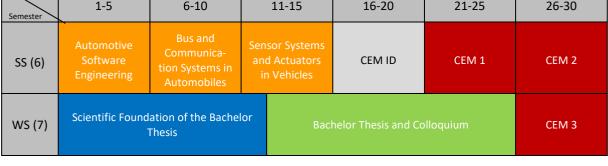

Mechatronics - Information technology

Mechatronics - Electrics / Electronics

Mechatronics - Mechanics
Supra-Disciplinary Qualification **CEM:** e.g. Tech. Thermodyn. / Higher Mech.

M: e.g. Tech. Thermodyn. / Higher Mech Electr. Drives / Prod. Techn.

Technical prerequisites	Students - Will know and understand basic business terms and economic facts. - Will know the most important constitutive decisions a company needs to make (business model, choice of location, legal form) and are able to describe possible forms of cooperation with other companies. - Can analyze and explain the management process and can link the elements of this process (planning, decision-making, management, organization, control) with the company's
Technical prerequisites	Students - Will know and understand basic business terms and economic facts. - Will know the most important constitutive decisions a company needs to make (business model, choice of location, legal form) and are able to describe possible forms of cooperation with other companies. - Can analyze and explain the management process and can link the elements of this process (planning, decision-making, management, organization, control) with the company's objectives.

	- Can point out the multi-faceted relationships between the
	business management sub-areas and can interpret and evaluate
	these relations.
Contents	Introduction to Business Administration
	- Terms & general relationships in business administration
	- Development of
	business
	administration
	management process
	- Company objectives
	- Planning
	- Decision-making
	- Control
	- Organization
	Constitutive decisions
	- Business model
	- Location selection
	- Cooperation programs
	- Legal form
	The individual functional areas according to Porter's value chain
	- Research and development
	- Purchasing and materials management
	- Production
	- Marketing and sales
	- Logistics
	- Customer service
	- Finances
	- HR
	- IT
Requirements for successful completion	Written examination
Media	Projector, blackboard, overhead projector
Literature	Schmalen, Helmut; Pechtl, Hans: Grundlagen und Probleme der
	Betriebswirtschaft, 14th ed., Stuttgart, Verlag Schäffer-Poeschel
	2009.

Vahs, D.; Schäfer-Kunz, J.: Einführung in die

Betriebswirtschaftslehre, 5th ed., Stuttgart (Schäffer-Poeschel)

2007.

Betriebswirtschaftslehre, 24th ed., Munich (Vahlen) 2010.

Automotive Mechatronics Internship and Occupational Safety

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Automotive Mechatronics Internship and Occupational Safety
Abbrev.	AMP
Subtitle	
Courses	-
Semester	6
Module coordinator	DiplIng. Michael Florschütz
Instructor(s)	DiplIng. Michael Florschütz et al.
Language	German
Classification in curriculum	Compulsory elective modules AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Internship / 4 SWH
Work requirement	In-class program: 24 hrs.
	Self-directed study: 128 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Students will be able to
	- Study theoretical foundations themselves.
	- Carry out practical experiments.
	- Prepare reports on the individual experiments.
	- Deepen / link basic theory.
Contents	Model-based application/development
	Engine control unit application
	Sensors and actuators
	Programming
	Data preparation
	Control engineering
Poquiroments for suggestive	Vehicle aerodynamics Proof of performance to accompany program
Requirements for successful completion	Proof of performance to accompany program

Bachelor Thesis and Colloquium

Academic program	Automotive Technology	
Specialization	Automotive Mechatronics /	
	Automotive Industrial Engineering	
Module name	Bachelor Thesis and Colloquium	
Abbrev.	BAC	
Subtitle	-	
Courses	Bachelor thesis, final colloquium presentation	
Semester	7	
Module coordinator	Dr. Stefan Gast	
Instructor(s)	Supervising professor	
Language	German	
Classification in curriculum	Compulsory module AMEC and WIAM	
Use in other	-	
academic programs		
Format / SWH	Bachelor's thesis	
Work requirement	Bachelor thesis:	
	- In-class program: 12 hrs.	
	- Self-directed study: 348 hrs.	
	Colloquium:	
	- In-class program: 6 hrs.	
	- Self-directed study: 54 hrs.	
ECTS	Bachelor thesis: 12	
	Colloquium: 2	
Technical prerequisites	According to SPO §5 (3), scientific/academic work and presentation	
Qualification objectives	Students will be able to	
	Develop complex, practical tasks using scientific methods to find	
	solutions with successful personal integration in an industrial	
	company.	
	Generate scientifically sound, written elaborations.	
	Explain their own ideas and results in the face of professional	
	criticism.	
	Independently implement time management while working on the	
	task.	

Contents	Scientific, application-oriented paper with practical relevance on a
	self-contained engineering or industrial engineering topic in the
	field of automotive mechatronics.
Requirements for successful completion	Bachelor thesis with subsequent colloquium / presentation
Media	(Not relevant)
Literature	see Scientific/Academic Work and Presentation

Technical prerequisites	Basics of computer science and programming (from computer science modules), electrical engineering Students will be able to: - Name the most important bus systems in the motor vehicle. - Describe the basics of serial data communication (e.g. bus physics, bus access methods, error detection in data transmission,) and transfer them to bus systems in the motor vehicle. - Explain the bit transmission and the data link layer (layer 1 + 2 in the ISO layer model) of the important bus systems in the vehicle (e.g. CAN) and transfer them by example to data

	- Realize simple ECU simulations in relation to bus
	communication in a tool-based manner.
Contents	- Basics of automotive bus systems (layer model, coding,
	wave propagation on conductors)
	- CAN bus (function, coding): Physical layer, data link
	layer, design
	- LIN bus (function, coding, configuration with ldf and lcf
	files)
	- FlexRay (function, coding, configuration with FIBEX files)
	- Ethernet (basics, applications: diagnostics and multimedia)
	- Measurements on CAN bus, LIN bus, and FlexRay
	- Configuration of CAN bus, LIN bus, and FlexRay
	- Introduction to programming with CAPL
Requirements for successful	Written examination
completion Media	Presentation, projector, blackboard, script
Literature	Werner Zimmermann, Ralf Schmidgall: Bussysteme in der
	Fahrzeugtechnik. Protokolle und Standards. Vieweg & Teubner
	Verlag.

	Mathias Rausch: FlexRay. Grundlagen, Funktionsweise, Anwendung. Hanser Verlag.

Business English (B2)

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Business English (B2)
Abbrev.	BE
Subtitle	•
Courses	-
Semester	4
Module coordinator	Barney Craven, M.A.
Instructor(s)	Barney Craven, M.A., Richard Fry, MCLFS
Language	English
Classification in curriculum	Compulsory module AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures, seminar and exercise / 2 SWH
Work requirement	In-class program: 22 hrs.
	Self-directed study: 68 hrs.
ECTS	3
Technical prerequisites	No formal prerequisites, but a plus are at least 6 years of school
	English enabling student to use language independently (B1 level
	of Common European Framework of Reference for Languages)
Qualification objectives	Expansion and improvement of individual English skills (reading,
	writing, listening comprehension, speaking) to the B2 level of the
	Common European Framework of Reference for Languages, with
	particular consideration of technical and professional topics
	From the Common European Framework of Reference for
	Languages (http://www.europaeischer-referenzrahmen.de/):
	"B2 – Independent use of language:
	Is able to understand the main contents of complex texts on
	specific and abstract topics; also understands technical
	discussions in own specialty

	. Is able to communicate spontaneously and fluently enough to
	permit normal conversations with native speakers without great
	effort on either side. Is able to express himself/herself clearly and
	in detail on a wide spectrum of topics, explain an opinion on a
	current question, and state the advantages and disadvantages of
	different possibilities."
	- Establishing and expanding basic vocabulary with business
Contents	terminology and expressions using texts from different areas
	- Training in written expression in English by working through
	texts and writing professional correspondence
	- Training verbal expression in English through discussion
	- As needed, review of grammar with exercises
Requirements for successful completion	Course-related work and written examination
Media	Projector and chalk board / whiteboard,
	electronic scripts, and work documents
	language lab
Literature	Current literature will be recommended during the course.

CAx Techniques

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	CAx Techniques
Abbrev.	CAX
Subtitle	•
Courses	-
Semester	4
Module coordinator	DiplEng. Frank Höllein
Instructor(s)	DiplEng. Frank Höllein
Language	German
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures with integrated exercises / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Students will be able to model components and
	assemblies using the CAx system "Siemens NX" and will
Contents	- Parametric associative modeling
	- Sketch creation
	- Reference elements
	- Part modeling (3D bodies and 2D surfaces)
	- Sheet metal part modeling
	- Extraction of drawings of components, detail elements
	- Bottom-up / top-down assemblies
	- Extraction of drawings of assemblies
Requirements for successful completion	One take-home paper
Media	CAx-workstation, beamer, script with videos in Moodle course

Literature	Sándor Vajna, Andreas Wünsch: Siemens NX für Einsteiger – kurz
	und bündig
	Maik Hanel, Michael Wiegand: Designing with NX

Qualification objectives Description of motion processes in different coordinate systems	ECTS	5
systems	Technical prerequisites	-
, and the second	Qualification objectives	Description of motion processes in different coordinate
Racic understanding of relative kinematics		systems
basic understanding of relative kinematics		Basic understanding of relative kinematics
Application of the Newton's second law for point masses		Application of the Newton's second law for point masses
Formulation of energy balances for point masses		Formulation of energy balances for point masses
Calculation of central collision processes		Calculation of central collision processes
Contents Foundations of kinematics:	Contents	Foundations of kinematics:
Definition of speed/velocity and acceleration, point kinematics,		Definition of speed/velocity and acceleration, point kinematics,
motion in a straight line (Cartesian coordinates), polar		motion in a straight line (Cartesian coordinates), polar
coordinates, natural coordinates, integration of the equations of		coordinates, natural coordinates, integration of the equations of
motion, relative kinematics, kinematics of rigid bodies (fixed axis		motion, relative kinematics, kinematics of rigid bodies (fixed axis
of rotation, 2D and 3D kinematics), instantaneous center of		of rotation, 2D and 3D kinematics), instantaneous center of
rotation		

	Kinetics of point masses:
	Newton's laws, basic dynamic equation ("F=m \cdot a"), free and
	guided point mass motion, constraint forces, resistance forces
	(incl. Coulomb friction), (principle of) momentum and angular
	momentum, collision processes, principle of work and energy,
	conservative forces and potential, d'Alembert's principle, dynamic
	force balance, systems of point masses (kinematic and physical
	constraints, degrees of freedom), principle of center of gravity/
	angular momentum
Requirements for successful completion	Written examination
Media	Chalk board, projector, supplemental written documents

Introduction to Transport Policy

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Introduction to Transport Policy
Abbrev.	VP
Subtitle	-
Courses	-
Semester	4
Module coordinator	Dr. Mathias Wilde
Instructor(s)	Dr. Mathias Wilde
Language	German
Classification in curriculum	Compulsory elective modules AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Students will receive an introduction to the subject area of
	transport policy along the three dimensions of the concept of
	politics: form (polity), content (policy), and process (politics).
	Knowledge of the political decision-making process, policy
	instruments, and legal regulations are conveyed. Students will get
	an overview of the players in transport policy in Germany,
	government institutions, and stakeholders. The possibilities and
	limits of the power to shape transport policy are taught and the
	development paths of future transport policy are shown. Students
	will become familiar with economic, social and ecological guiding
	principles, and will learn to evaluate social power and dominance
	relationships. In this way,

	students will learn to recognize the interrelationships of
	transport policy decisions across the various political levels, to
	classify conflicts of interest, and to identify the possibilities of
	influencing transport policy as well as instruments of control.
Contents	- Goals and instruments of transport policy
	- Players/stakeholders in transport policy
	- Decision-making levels
	- Transport policy in the federal states and municipalities
	- Transport policy in Germany between market
	regulation, services of general interest, and competition
	- European transport policy, goals, and basics
	- Regulation of transport markets
	- Liberalization of transport markets
	- Transport infrastructure planning and investment as
	a core public task
	- Transport services in public and private ownership
Requirements for successful completion	Portfolio (seminar paper 70% and presentation 30%)
Media	Projector, blackboard, overhead projector

Module name	Electrical Engineering
Abbrev.	EMAB
Subtitle	-
Courses	-
Semester	6
Module coordinator	Dr. Matthäus Brela
Instructor(s)	Dr. Matthäus Brela
Language	German
Classification in curriculum	Compulsory elective modules AMEC and WIAM
Use in other	Bachelor in "Automation Technology and Robotics" /
academic programs	Bachelor in "Electrical Engineering and Information
	Technology" / Bachelor in "Power Engineering and
Format / SWH	Seminar-type lectures / 2 SWH, excursion / 1 SWH,
	seminar paper / 1 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Basic knowledge of electrical drive technology
Qualification objectives	Students will be able to
	Understand the operation and structure of electrical
	machines.
	Name and evaluate the steps involved in the
	manufacture of electrical machines.
	Reproduce the manufacturing processes necessary
	for production.
	Analyze, evaluate and develop the manufacturing chain of
	electrical machines holistically.
Contents	Typical applications / fields of application of
	electrical machinery manufacturing

- Electromagnetic and mechanical fundamentals of electrical machines
- Basic motor topologies
- Components of the drive train
- Manufacturing processes for electrical steel strip, electrical single sheet and sheet stack as well as production-related influencing factors
- Fundamentals of loss effects and numerical analysis methods
- Production of hard magnetic materials as well as quality assurance and failure analysis
- Magnetization and magnet assembly
- Winding technology, impregnation, and insulation
- Manufacturing of power electronics
- Assembly processes and testing technology for quality assurance at the end of the value chain
- Electromagnetic actuators, their manufacturing processes, and quality assurance
- Recycling of electrical machines and their components
- Traceability and I4.0 in electrical engineering
- Basics of contactless power transmission and inductive charging systems
- Additive manufacturing in electrical engineering
- Superconductor electric motors and transfer systems

Requirements for successful completion	Written exam 60 min. and seminar paper (weighting 3:1)
Media	Projector and blackboard/whiteboard, simulation
	programs, electronic scripts and working documents,
	practical exercises.
Literature	Elektrische Servoantriebe, Manfred Schulze, 2008, ISBN 978-3-
	446-41459-4

Electronics

Academic program	Automotive Technology
Specialization	Automotive Mechatronics
Module name	Electronics
Abbrev.	ELEK
Subtitle	-
Courses	-
Semester	3
Module coordinator	Dr. Peter Raab
Instructor(s)	Dr. Peter Raab Yannick
	Pfister (B.Eng.)
Language	German
Classification in curriculum	Compulsory module AMEC
Use in other	-
academic programs	
Format / SWH	Seminar-type lecture / 3 SWH, internship / 1 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Electrical engineering 1 and 2
Qualification objectives	Students will learn about applications from the field of
	electronics / digital technology in the automotive sector.
	Students will be able to
	- Name electronic components and explain their function.
	- Explain basic electronic circuits (e.g. transistor circuits) and
	their applications.
	- Dimension basic electronic circuits.
	- Recognize electronic circuits in automobiles and
	adapt them to the requirements of automotive
	engineering.
	- Understand and explain the function and structure
	of simple digital circuits.

	C 1
	- Carry out measurements with typical measuring
	instruments in electronics.
Contents	Part 1: Electronic components
	1. Basics of semiconductor electronics (conduction mechanisms,
	pn-junction, metal-semiconductor junction, MOS capacitor)
	2. Semiconductor diodes
	3. Bipolar transistors
	4. Field effect transistors
	5. Components of power electronics
	part 2: Circuitry (analog)
	6. Basic circuits of transistors
	7. Circuit design
	8. Operational amplifier
	9. Analog-to-digital and digital-to-analog converters
	10. Power supply
	Part 3: Digital technology (optional)
	11. Boolean (switching) algebra
	12. Circuit families
	13. Digital circuit technology
	14. Sequential logic
	15. Memory technologies
Requirements for successful completion	Written examination and practical proof of performance
Media	Lecture, beamer, blackboard

	SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Students will be able to
	Interpret DC networks.
	Evaluate the effect of passive components (resistor, capacitor,
	coil) in DC networks.
	Relate the effect of DC electrical networks in motor vehicles.
	Explain the effect of magnetic circuits.
	Relate applications of magnetic circuits in motor vehicles.
Contents	Current, voltage and power in DC electrical circuits, parallel and
	series connections of resistors, effect of passive components
	(resistors, capacitors, inductors) in DC circuits, switching on and
	off processes in DC circuits, electromagnetism, induction
	processes

Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Basic knowledge in metallic materials
Qualification objectives	- Familiarization with manufacturing processes for
	machining metallic materials.
	- Ability to select suitable manufacturing processes
	depending on defined boundary conditions.
Contents	- Principles of chipping, wear
	- Cutting materials and cooling lubricants
	- Tool monitoring
	- Lathing
	- Milling
	- Drilling
	- Sanding
	- Honing, lapping

	- Sintering
	- Foundations forming technology
	- Rolling
	- Continuous and discontinuous extrusion
	- Smithing
	- Deep-drawing
	- Bending
	- Splitting, punching
	- Ablation
	- Welding
	- Soldering, gluing
Requirements for successful completion	Written examination

Advanced Dynamics / Machine Dynamics

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Advanced Dynamics / Machine Dynamics
Abbrev.	HDY
Subtitle	-
Courses	-
Semester	6
Module coordinator	Dr. Martin Prechtl
Instructor(s)	Dr. Martin Prechtl
Language	German
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	Bachelor in "Mechanical Engineering"
academic programs	
Format / SWH	Seminar-type lectures / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Engineering Mathematics I and II, Statics and Strength of
	Materials, Dynamics and Vibration I and II
Qualification objectives	Prediction of a drive on the basis of the basic methods of
	dynamics
	Application of the principle of virtual work as well as
	Lagrangian equations of 1st and 2nd kind for the
	determination of equations of motion
	Basic understanding of the properties of the motion of spinning
	tops
	Calculation of dynamic bearing reactions and the required
	masses for balancing components
	Mathematical description and analysis of coupled oscillators
	Calculation of bending natural frequencies and critical
	speeds

	Basic understanding of mathematical modeling of continuum
	oscillations
Contents	Mathematical methods:
	d'Alembert's principle according to Lagrange, virtual work,
	Lagrangian equations of 1st and 2nd kind, generalized
	coordinates and forces, constraints
	Spatial rigid body kinetics:
	principle of center of gravity or principle of moments, principle
	of work and energy, angular momentum, inertia tensor /
	matrix, Steiner-Huygens theorem, principal axis system, Euler
	derivation, Euler's equations, motion of force-free and non-
	force-free, symmetrical tops, gyroscopic movement, self-
	centering effect, dynamic bearing reactions, structural analysis
	and dynamic balancing
	Advanced vibration theory:
	systems with several degrees of freedom (DE system), damped
	natural angular frequency, harmonic excitation, frequency
	response and vibration damping, bending vibrations (massless
	beams with attached point masses), influence coefficient and
	Castigliano's theorem, critical revolution speeds, and bending
	vibrations of continua
Requirements for successful completion	Written examination
Media	Chalk board, projector, supplemental written documents

Computer Science for Mechatronics Engineers II

Academic program	Automotive Technology
Specialization	Automotive Mechatronics
Module name	Computer Science for Mechatronics Engineers II
Abbrev.	INM2
Subtitle	•
Courses	-
Semester	2
Module coordinator	Dr. Ralf Reißing
Instructor(s)	Dr. Ralf Reißing
	DiplIng. Andreas-Michael Geißler
Language	German
Classification in curriculum	Compulsory module AMEC
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures / 2 SWH, programming exercises / 2
	SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Computer Science for Mechatronics Engineers I
Qualification objectives	- Applying advanced algorithm concepts
	- Using advanced concepts of the C programming language
	- Analyzing and programming complex C programs
	- Solving technical problems with C
	- Perform independent software project in a team
Contents	Algorithm analysis
	Design methods for algorithms
	More complex examples for algorithms
	Advanced concepts in C
	Quality aspects of design and implementation
	Practical training in software development in a team
Requirements for successful completion	Written examination

Media	Presentation, projector, blackboard, computer exercises
Literature	-

Fuel Analysis and Exhaust Gas Measurement Technology

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
•	Automotive Industrial Engineering
Module name	Fuel Analysis and Exhaust Gas Measurement Technology
Abbrev.	KAA
Subtitle	-
Courses	
Semester	6
Module coordinator	Dr. Markus Jakob
Instructor(s)	Dr. Thomas Garbe Dr.
	Markus Jakob Dr. Olaf
	Schröder
Language	German, English
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	Bachelor in "Engineering Physics"
academic programs	
Format / SWH	Seminar-type lectures / 2 SWH, internship block / 2 SWH
Work requirement	In-class program: 60 hrs.
	Self-directed study: 90 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Part 1 (Fuels):
	Students will be able to identify and analyze the physical,
	chemical, and analytical problems of fuel and engine oil
	interactions, and can evaluate them in terms of engine and
	exhaust effects.
	Part 2 (Emissions):
	Students will be able to understand engine combustion
	(technical aspect), the formation of pollutants (chemical
	aspect), and their analytical measurement techniques
	(analytical aspect). In addition, the
	(analytical aspect). In addition, the

chemical functions of exhaust gas after-treatment are explained and the analytical instruments for the determination of the limited and non-limited exhaust gas components are clarified. Contents Part 1 (Fuels): Fluid analysis; introduction to fuel and oil chemistry, fossil and biogenic components, chemical reactions and their effects on physical and engineering applications. Aging studies. Practical training: Chemical analyses using UV-Vis, FTIR, GC-FID, GC- MS, HPLC, ASS, ICP-MS, GPC-MS, ZLIF, NIR, dielectric spectroscopy, and standard fuel analysis Part 2 (Emission Focus): Gas analysis; introduction to combustion chemistry and

Methods of Experimental Methodology

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Methods of Experimental Methodology
Abbrev.	MVD
Subtitle	-
Courses	-
Semester	7
Module coordinator	Dr. Thomas Garbe
Instructor(s)	Dr. Thomas Garbe
Language	German
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	Academic programs of the AN department
academic programs	
Format / SWH	Seminar-type lectures / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	After successful completion, students will be familiar with:
	- The theoretical background on conducting experiments
	in science and industry
	- Flowcharts for performing experiments
	- Selected tools for planning and conducting experiments
	- Examples of real experimental projects with different
	objectives
Contents	The lecture contents include
	- The classification of experiments in the
	methodology of knowledge acquisition
	- Theoretical and application-related backgrounds for the
	execution of experiments

- Details of a test procedure during the planning, execution, and evaluation phases
- Selected tools for carrying out experiments such as statistical test planning, use of test rigs, and test cycles
- The application of standardized methods
- The transfer of test results into real applications

Requirements for successful completion	Written examination
Media	Projector, blackboard, PC, crafts materials

Classification in curriculum	Compulsory module AMEC
Use in other	-
academic programs	
Format / SWH	Seminar-type lecture / 2 SWH; internship parallel to lectures
	/ 2 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Computer Science for Mechatronics Engineers I and II
Qualification objectives	At the end of the semester, students will be able to:
	- Describe the structure and operation of
	microprocessors/microcontrollers.
	- Program microcontrollers used for automotive applications.
	- Name important peripheral units of microcontrollers and use
	them in embedded systems.
	- Describe and evaluate the real-time requirement of
	automotive ECUs.
	- Configure a real-time operating system
	(OSEK) used for automotive applications.
Contents	- Overview of microprocessor architectures

- Structure, function, and programming of a microcontroller used in automotive applications and important peripheral units (interrupt controller, timer, ADC, ...)
- Development tools (assembler, compiler, linker, debugger) for embedded SW development
- Basics of real-time operating systems (multitasking, scheduler, scheduling algorithms, synchronization and communication mechanisms)
- Services and configuration of an automotive real-time operating system (introduction to OSEK)

	operating system (introduction to OSEK)

Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Automotive Mechatronics Project
Abbrev.	PAM
Subtitle	-
Courses	-
Semester	6 or 7
Module coordinator	Dr. Stefan Gast
Instructor(s)	Dr. Stefan Gast
Language	German
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Take-home assignment
Work requirement	In-class program: 30 hrs.
	Self-directed study: 120 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Students will be able to
	Plan an independent solution for a technical and / or industrial
	engineering specific task from the field of automotive
	mechatronics - also in a team - while taking into account time
	management.
	Implement the time management independently in the project.
	Undertake independent familiarization of the task and
	independently develop a solution for the task.
	Generate documentation according to engineering standards.
Contents	Familiarization with a task from the field of automotive
	mechatronics, independent solution finding, independent time
	management described as a final remark as defined in
	management, documentation as a final report as defined in

	the module "Scientific/academic work and
	presentation".
Requirements for successful completion	Final report

Project Management of Mechatronic Vehicle Systems I

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Project Management of Mechatronic Vehicle Systems I
Abbrev.	PMA1
Subtitle	•
Courses	-
Semester	3
Module coordinator	Dr. Alexander Rost
Instructor(s)	Dr. Alexander Rost
Language	German
Classification in curriculum	Compulsory module AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures / 1 SWH, exercise / 1 SWH
Work requirement	In-class program: 22.5 hrs.
	Self-directed study: 52.5 hrs.
ECTS	5 (PMA1 and PMA2)
Technical prerequisites	-
Qualification objectives	Students will know what fundamental project management
	methods there are and how to apply them.
	Students will learn how to consistently plan and work on their
	project as a process in a team.
	project as a process in a team. Students will be able to develop project visions and goals.
	Students will be able to develop project visions and goals.
	Students will be able to develop project visions and goals. Students will improve their collaboration abilities and work
Contents	Students will be able to develop project visions and goals. Students will improve their collaboration abilities and work techniques.
Contents	Students will be able to develop project visions and goals. Students will improve their collaboration abilities and work techniques. The "social skills" of the students will be improved.
Contents	Students will be able to develop project visions and goals. Students will improve their collaboration abilities and work techniques. The "social skills" of the students will be improved. Role understanding
Contents	Students will be able to develop project visions and goals. Students will improve their collaboration abilities and work techniques. The "social skills" of the students will be improved. Role understanding From idea to clarified assignment

	Project collaboration
	·
	Vision and goals
	Procedure and milestones
	Overview of all Pj tasks
	Project phases
	Process and time planning
	Presentation techniques
	Voice training
Requirements for successful completion	Written examination according to PMA 2
Media	Script, projector, blackboard, overhead projector,
	audio and video presentations
Literature	The lecturer provides a script in the form of checklists
	and questions.

Project Management of Mechatronic Vehicle Systems II

Quality Management

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Quality Management
Abbrev.	QM
Subtitle	
Courses	-
Semester	4
Module coordinator	Dr. Oliver Koch
Instructor(s)	Dr. Oliver Koch
Language	German
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	- Understanding the need for and objectives of
	quality management
	- Getting acquainted with the standards and definitions
	- Understanding the structure of quality management systems
	and organization
	- Knowing the tools of quality management in the product
	development process, in production, and in product use
	- Ability to select suitable quality management tools and
	to apply them in principle
Contents	- Historical development
	- Standardization and definition
	- Organization of QM systems

	- Methods of quality management in the product
	development process (QFD, FTA, FMEA, DRBFM)
	- Methods of quality management in production (process and
	measurement capability, SPC, supplier management)
	- Quality management in product use (8D systematics,
	documentation)
	- Operational improvement programs (Kaizen lean production
	and Six Sigma methodology)
Requirements for successful completion	Written examination
Media	Lecture, projector, blackboard, script/textbook
Literature	Schmitt, Pfeifer: "Qualitätsmanagement".

Format / SWH	Seminar-type lecture, exercises / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Engineering Mathematics I - III, Control Technology,
	Engineering Mechanics
Qualification objectives	This course will enable students to:
	Derive different representations of dynamic models and
	implement models of dynamic systems on a simulation platform.
	Perform simulations.
	Present numerical solution methods.
Contents	Introduction of the concepts of dynamic system and state
	space and the principles of simulation of dynamic systems
	Representation of signal flow based system models in Matlab-
	Simulink Discontinuous system behavior - reinitialization
	Fundamentals of state machines and StateFlow
	Fundamentals of numerical solution of differential equations

	Explicit and implicit methods One-step method (Runge-Kutta), stability
Requirements for successful completion	Written examination

Technical prerequisites	No formal prerequisites, but a plus are at least 6 years of school English enabling student to use language independently (B1 level of Common European Framework of Reference for Languages) Expansion and improvement of individual English skills (reading, writing, listening comprehension, speaking) to the B2 level of the Common European Framework of Reference for Languages, with particular consideration of technical and professional topics From the Common European Framework of Reference for Languages (http://www.europaeischer-referenzrahmen.de/): "B2 – Independent use of language Is able to understand the main contents of complex texts on

	. Is able to communicate spontaneously and fluently enough to
	permit normal conversations with native speakers without great
	effort on either side. Is able to express himself/herself clearly and
	in detail on a wide spectrum of topics, explain an opinion on a
	current question, and state the advantages and disadvantages of
	different possibilities."
Contents	- Structure and expansion of basic vocabulary with technical
	terminology and expressions using texts from different areas
	- Training in written expression in English by working through
	texts and writing professional correspondence
	- Training in verbal expression in English through discussion
	- As needed, review of grammar with exercises
Requirements for successful	Course-related work required for admission to the
completion	examination and written exam
Media	Projector and chalk board / whiteboard,
	electronic scripts, and work documents
	language lab
Literature	Current literature will be recommended during the course.

Students can calculate with complex numbers. Students will be familiar with the elementary properties of real-valued functions. Students will be able to transform function terms by polynomial division as well as partial fraction decomposition. Methodological skills: Students will be able to mathematically apply the acquired technical knowledge to physical and engineering problems and

	Students will be able to optimize their personal time
	management for material preparation and follow-up, practice,
Contents	Foundations:
	Propositional logic and elementary methods of
	proof. Basics of linear algebra:
	Matrices, vectors, determinants, Laplacian development theorem,
	systems of linear equations, Gauss algorithm, matrix rank,
	Cramer's rule, eigenvalue problems, eigenvalues and
	eigenvectors.
	Complex numbers:
	Definition, component, polar and exponential form, Gaussian
	number plane, Moivre's theorem, Euler's relation, circle division
	equation "z^n = a", quadratic equations (sol. in complex).
	Sequences and series, limits:
	Arithmetic and geometric number sequences, limit
	definition, numerical series, convergence and divergence,
	summation formulas
	Real-valued functions:
	Concept of a function, inverse function, shifting and reflection of
	graphs, continuity, trigonometric equations, hyperbolic and area
	functions, polynomials, fundamental theorem of algebra, rational
	functions, polynomial division and Horner's scheme, function
	series (uniform convergence)
	Introduction to differential calculus:
	Slope of a curve, definition of first derivative, differential
	quotient, higher derivatives, product rule, quotient rule, chain
	rule, derivation of inverse function, implicit differentiation,
	curve discussion, zeros and poles/singularities, and relative and
	absolute maxima
Requirements for successful completion	Written examination
Media	Visualizer, projector, laptop, chalk board

Bronstein-Semendjajew: Mathematische Formelsammlung
"Taschenbuch der Mathematik, Harri Deutsch.

Engineering Mathematics II

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Engineering Mathematics II
Abbrev.	MAT2
Subtitle	
Courses	-
Semester	2
Module coordinator	Dr. Ingo Faber
Instructor(s)	Dr. Ingo Faber
Language	German
Classification in curriculum	Compulsory module AMEC and WIAM
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures with exercises / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Engineering Mathematics I
Qualification objectives	Application of differential calculus with one variable to
	specific problems
	Mastery of integral calculus with one real variable
	Application of integral calculus with one variable to
	specific problems
	Basic understanding of functions with several variables
	Mastery of the technique of partial derivative
	Calculation of absolute and relative error
	Solution of multiple integrals in different coordinates as well as
	their application to specific problems
Contents	Applications of differential calculus:

Extreme value problems, Newton-Raphson method, linearization, differential, error estimation, Taylor series, Lagrange residual representation, power series expansion, MacLaurin series, linear differential equations (DGLs) with constant coefficients Fundamentals of integral calculus:

Root function, indefinite integrals, calculation rules, substitution in indefinite integrals, integration of fractional rational functions, fundamental domain, main theorem of differential and integral calculus, integral function, substitution in definite integrals, partial integration, improper integrals, selected applications of integral calculus: Integral averages, volume calculation, center of gravity of solids of revolution.

Functions with several variables:

Concept of a function, partial derivatives, continuity, complete differential, moment of area and mass inertia, relative extrema, optimization with constraints.

Requirements for successful completion	Written examination
Media	Visualizer, projector, laptop, chalk board
Literature	Papula, L.: Mathematik für Ingenieure und Naturwissenschaftler (3 volumes, 1 exercise book, and collection of formulas),

Engineering Mathematics III

Academic program	Automotive Technology
Specialization	Automotive Mechatronics
Module name	Engineering Mathematics III
Abbrev.	MAT3
Subtitle	·
Courses	-
Semester	3
Module coordinator	Dr. Marcus Baur
Instructor(s)	Dr. Marcus Baur
Language	German
Classification in curriculum	Compulsory module AMEC
Use in other	-
academic programs	
Format / SWH	Seminar-type lectures with integrated exercise / 4 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	Engineering Mathematics I and II
Qualification objectives	Ability to solve ordinary differential equations
Contents	Extremal problems with constraints
	Fundamentals of vector analysis
	Ordinary differential equations: First
	order differential equations Linear
	differential equations
Requirements for successful completion	Written examination
Media	Visualizer, projector, blackboard, laptop
Literature	Heuser, H., "Gewöhnliche Differentialgleichungen",
	Springer Verlag, 2006.
	Papula, L.: "Mathematik für Ingenieure und Naturwissenschaftler -
	Vol. 2", Vieweg+Teubner Verlag.

Technical Thermodynamics

Academic program	Automotive Technology
Specialization	Automotive Mechatronics /
	Automotive Industrial Engineering
Module name	Technical Thermodynamics
Abbrev.	TTD
Subtitle	•
Courses	-
Semester	4
Module coordinator	Dr. Philipp Epple
Instructor(s)	Dr. Philipp Epple
Language	German
Classification in curriculum	Compulsory elective module AMEC and WIAM
Use in other	Bachelor in "Mechanical Engineering"
academic programs	
Format / SWH	Seminar-type lectures / 2 SWH, exercise / 2 SWH
Work requirement	In-class program: 45 hrs.
	Self-directed study: 105 hrs.
ECTS	5
Technical prerequisites	-
Qualification objectives	Students will be able to:
	- Differentiate state and process variables and calculate
	special gas constants.
	- Understand phase diagrams and calculate state
	variables in two-phase domain.
	- Apply the first law of thermodynamics to closed and open
	systems.
	- Apply the second law of thermodynamics to various systems.
	- Calculate the properties of ideal gases and gas mixtures.
	- Calculate simple cycles.
Contents	System and state processes
	and process parameters

	Phase diagrams
	1. Principal law of thermodynamics
	2. Principal law of thermodynamics
	State variables of ideal gases
	Gas mixtures, moist air, and steam
	Cycles of engines
	Selected adiabatic flow process
Requirements for successful completion	Written examination
Media	Chalk board, projector, supplemental written documents
